Anticholinergics

The effects of anticholinergic medications appear to mimic dementia. They may reduce the ability to concentrate, and because they can cause people to make worse decisions & drive impulsively, each point appears to increase early death risk (mortality) by 26% & every 2 or 3 score to increase cognitive impairment by 46%.

Isocarboxazid (Marplan, Marplon, Enerzer) an MAOI is at least a type I anticholinergic
